

ARMOURY MANAGEMENT & SECURE DOOR ACCESS

This module is already in use in more than 100 British police armouries, dealing with over 40,000 transactions daily, protecting your firearms inventory round the clock.

Chronicle controls access to armouries and weapons based on an individual's current authorisation level, and is seamlessly linked to the [Firearms Training module](#) to ensure only currently classified officers can draw weapons. It manages the issue and return of weapons to officers, weapons maintenance records and ammunition stock.

Tiny RFID (radio frequency identification) tags are fixed to each weapon so that it has a unique record number and history. Weapons are assigned to individual officers by being scanned in and out of the armoury using the RFID, with alerts provided if weapons are overdue for return.

This means organisations can centrally monitor the issue and return process from any networked mobile device anywhere in their force area, regional collaboration and beyond.

In addition, Chronicle provides armourers with the maintenance and deployment history of each weapon, providing automatic email or SMS alert when service is due. It also prevents weapons with an incomplete maintenance history or recorded fault being issued for deployment.

Robust audit and reporting capability with stands scrutiny in post incident enquiry and has already been used for this purpose.

And its use beyond the police firearms world are obvious – Chronicle can be used to monitor and limit access to any high risk or high value equipment. This module can be linked to the [Asset Management and Asset Cabinet modules](#), featuring our specialist bespoke cabinets for a number of applications including Taser®. It can also be used with vehicles, surveillance equipment or in an infinite number of other items valuable to your organisation.
